

Geologically Hazardous Areas

Before land clearing, building, or making other changes to your land on or near a landslide hazard area, you generally need a permit and the professional preparation of a special report. Put simply, a landslide hazard area is land with a slope, which is at risk of moving and therefore poses a danger to the public. Land within 300 feet of the slope may also be at risk and is required to be reviewed as well.

The Geological Assessment (with checklist) shall be prepared at the discretion of the Director by either a licensed civil engineer with specialized knowledge of geotechnical/geological engineering or a licensed geologist or engineering geologist with special knowledge of the local conditions. The preparer shall be licensed in the State of Washington.

The Geotechnical Report (with checklist) shall be prepared at the discretion of the Director by a licensed civil engineer with specialized knowledge of geotechnical/geological engineering or a licensed engineering geologist. The preparer shall be licensed in the State of Washington.
